

PALANTIR · ENTERPRISE AI PLATFORM

Introduction to Palantir Foundry

The operational data platform that turns siloed enterprise data into a living digital model
— and puts AI to work on real decisions.

WHAT IT IS

A central operating system for your data

Palantir Foundry is the company's commercial platform — a single environment where an organization integrates all of its data, models it, and runs day-to-day operations on top of it.

Its defining idea is the **Ontology**: a digital twin that maps real-world objects — an aircraft part, a hospital bed, a shipment, a vendor contract — and the relationships between them.

Instead of querying raw tables, people interact with the business itself — plants, SKUs, customers — and decisions made in Foundry are captured back as data.

Integrate

Connect every source — ERPs, sensors, spreadsheets, clouds — into one governed foundation.

Model with the Ontology

Build a digital twin of objects and their links, not just disconnected datasets.

Operationalize

Turn insight into action and feed every decision back into the model.

HOW IT WORKS

From raw data to operational decisions

Foundry closes the loop: data flows in, becomes a model of the business, drives action, and the results return as new data.

01

Integrate data

Pull together hundreds of sources — ERP, IoT, logs, files — with lineage and governance built in.

02

Build the Ontology

Map real-world objects and relationships into a shared, reusable digital twin.

03

Apply AI & analysis

Run models and LLMs (via AIP) directly on governed objects, not loose data.

04

Act & capture

Frontline users make decisions in-app; each choice is recorded as new data.

USE CASES

One platform, many industries

Foundry is industry-agnostic — wherever data is siloed and decisions are complex, the same ontology approach applies.

Aerospace

Predictive maintenance and fleet operations from in-flight sensor data.

Manufacturing

Digital twins of plants, supply chains and bill-of-materials optimization.

Healthcare

Connect patient, capacity and supply data to coordinate care and resources.

Supply chain

Real-time control towers that cut stock-outs and balance inventory.

Financial services

Risk, fraud and operational finance modeled on live operational data.

Energy & utilities

Asset monitoring that predicts failure and schedules maintenance.

Airbus Skywise: the aviation industry's data backbone

Launched in 2017 and built on Foundry

Skywise connects in-flight, engineering and operational data across airlines, suppliers and Airbus factories into one secure environment.

A modern aircraft generates up to a terabyte of data per day. Engineers track individual components, predict failures before they happen, and share insight across the fleet.

When unexplained valve leaks appeared on certain engines, teams compared sensor data fleet-wide and traced the fault to a control-software issue — catching a cascading failure risk before it caused an accident.

PROVEN RESULTS

Measurable outcomes across customers

Reported by Palantir customers and at company events — a sample of the operational value Foundry has delivered.

\$60M

profit improvement

Sompo (insurer) over three years — with \$100M more projected.

\$9M

annual cost cut

Fujitsu achieved this within just three months of deployment.

~50%

fewer stock-outs

A global retailer's supply-chain control tower built on Foundry.

26%

more engine output

GE Aerospace improvement for commercial & military customers.

70%

faster migration

SAP cut cloud-migration time & cost at >99% validation accuracy.

7+

ERP sources unified

A consumer-products firm built a digital twin of its value chain.

BENEFITS

Why organizations choose Foundry

Breaks data silos

One governed foundation replaces dozens of disconnected systems and spreadsheets.

Operational, not just analytical

Goes beyond dashboards — decisions and actions happen inside the platform.

No-code access for operators

Plant managers and planners work with business objects, no SQL required.

AI-ready by design

AIP lets LLMs act safely on real, governed data instead of loose documents.

Security & governance built-in

Lineage, access controls and deployment (Apollo) across cloud, hybrid & classified.

Fast time-to-value

Bootcamps and reusable patterns get production workflows live in weeks, not years.

MARKET VALUE

A category-defining enterprise AI company

\$300B+

Market capitalization

Among the world's ~50 most valuable companies (Jun 2026).

\$1.63B

Q1 2026 revenue

Up 85% year-over-year — fastest growth since its 2020 IPO.

1,007

Total customers

Up 31% year-over-year, commercial logos accelerating.

60%

Adj. operating margin

Highly profitable; ~\$8B cash and no debt on the balance sheet.

Annual revenue growth (\$B)

FY2026 figure is company guidance midpoint (~\$7.66B).

Where Foundry is heading

Commercial overtaking government

U.S. commercial revenue grew 133% in Q1 2026 and is set to overtake the government business — retiring the 'government contractor' label.

The AIP era

The Artificial Intelligence Platform brings LLMs and autonomous agents directly onto the ontology, the fastest-growing driver of adoption.

Sovereign & edge deployment

Partnerships (e.g. NVIDIA's 'Sovereign AI OS') extend Foundry to data-sovereign, latency-sensitive and disconnected environments.

Land-and-expand at scale

Average revenue from top-20 customers reached \$108M, up 55% YoY — proof that deployments deepen once embedded.

IN SUMMARY

Key takeaways

Foundry is an operational OS

Built on the Ontology — a digital twin of the business — not just another analytics or BI tool.

Value is proven and measurable

From Airbus Skywise to Sompo and GE Aerospace, customers report millions in savings and efficiency gains.

AI-native and governed

AIP puts LLMs and agents to work on real, secured data — the differentiator in the enterprise AI race.

A market leader, still accelerating

~\$300B market cap, 85% revenue growth, and commercial demand expanding across every industry.
